

MERN STACK HACKATHON

Problem Statement

Build a Startup Investment Intelligence Platform

Deadline

Tomorrow — 9:00 PM

Problem

Investment teams often manage startup information across spreadsheets, documents, emails, and multiple platforms. This makes it difficult to maintain structured startup data, evaluate opportunities consistently, and track the investment pipeline.

Your Challenge

Build a **MERN-stack web application** that enables an investment team to discover, evaluate and track early-stage startups from a single dashboard.

Core Requirements

1. Startup Management

- Add, edit and delete startup profiles.
- Store company name, industry, stage, founder details, website, location and description.
- Display startups in a searchable and filterable dashboard.

2. Founder Evaluation

Create an evaluation form covering founder experience, domain expertise, execution capability, vision and team strength. Generate an overall founder score.

3. Investment Analysis

Allow analysts to record market opportunity, business model, competitive landscape, revenue, growth potential, key risks and investment thesis.

4. Investment Decision

Provide three decision states: **Invest | Watchlist | Reject**. Analysts should be able to add comments explaining their decision.

5. Dashboard

Show total startups, startups under evaluation, invested startups, watchlist, rejected startups and average founder score.

Technical Requirements

MongoDB — Database Express.js — Backend/API React.js — Frontend Node.js — Server

Additional expectations: REST APIs, proper CRUD operations, form validation, responsive UI, error handling, clean and modular code, and a Git/GitHub repository.

Evaluation Criteria

Criteria	Weight
Functionality & CRUD	25%
MERN Implementation	20%

Backend / API Quality	15%
Frontend / UI & UX	15%
Database Design	10%
Investment Workflow & Logic	10%
Code Quality	5%

Final Objective

Build a working investment intelligence platform — not just a UI prototype. The submission should demonstrate your ability to take a business problem, design the architecture, build the application end-to-end, and deliver a functional MERN product within the deadline.

Submission Deadline: Tomorrow at 9:00 PM
